## PVDF Limited 30 Year Protective Coating Warranty

### Performance Guarantee

Mid Florida Metal Roofing Supply, Inc., hereinafter referred to as Mid Florida Metal Roofing Supply or Seller, guarantees to the original building Owner (Owner) that within the Continental United States normal outdoor atmospheric conditions (which term excludes corrosive or aggressive atmospheres such as those contaminated with chemical fumes or salt spray) will not cause the paint on the roofing or siding panels sold to you under this guarantee to:

1. Crack, check or peel.

**Note:** A crack is a break in the coating sufficiently deep that the underlying surface is visible. Checking refers to shallow breaks in the coating which do not expose the underlying surface. Peeling occurs when the coating actually comes off the metal in pieces. Slight crazing or cracking may occur on roll formed edges or brake bends at the time of forming and should be considered standard and shall not constitute a basis for complaint under this warranty. However, the film will not lose adhesion to the substrate when cellophane tape applied at the bend is removed.

2. Chalk in excess of a numerical rating of eight for roof and siding panels when measured in accordance with the standard procedure specified in ASTM D659 (latest).

**Note:** Chalk refers to the formation of loose, removable powder evolved from the coating itself upon breakdown of its resin or binder. The test merely utilizes dark or light colored felt rubbed against the surface to pick up a measurable amount of the chalk, which is then compared to a standard. On a scale of 10 (best) to 0 (worst), a rating of eight is considered a moderate amount of chalk while a rating of two would represent extreme chalk.

3. Fade or change in color in excess of five units of color difference ("NBS" unites) for roofing and siding panels when measured in accordance with the standard procedure specified in ASTM D2244 (latest) paragraph 4.3 on a washed test area.

**Note:** Most coated surfaces when exposed to he sun will fade to some degree over a period of time. Five NBS unites is a noticeable, but not usually objectionable, degree of color change. Colors may also darken or change hue rather than fade, particularly on exposure in polluted environments. The NBS units are intended to apply to color change in either direction in comparison with the original or unexposed color. It is understood that fading or color change may not be uniform if the surfaces are not equally exposed to the sun and elements.

For purposes of determining whether an exposed coated panel meets the standards set forth in above paragraph, all chalk, dirt and other film deposits on the area of the panel to be tested for color must be removed by washing prior to evaluation. To wash test area, use a pad of 28/24 mesh cheesecloth and distilled water with mild soap and detergent cleaner. Wet the cheesecloth thoroughly with the solution and rub it, using moderate hand pressure, over an area of panel approximately 4" x 4". Care must be taken to avoid any scratching, burnishing or other physical alteration of the coating surface. After washing as described above, flush off the test area with distilled water and allow to air dry in a vertical position.
